

## 9.7 Differentiating in Polar Form

Calculus

Name: \_\_\_\_\_

CA #2

- Find the slope of the tangent line to the polar curve  $r = 4$  at  $\theta = \frac{\pi}{4}$ .
- A particle moves along the polar curve  $r = 5 \sin 2\theta$  so that  $\frac{d\theta}{dt} = 2$ . Find the value of  $\frac{dr}{dt}$  at  $\theta = \frac{\pi}{2}$ .
- For  $0 \leq \theta \leq 2\pi$ , find the values of  $\theta$  for which the polar curve  $r = 1 - \sin \theta$  **might** have a vertical tangent line. Second, use a graphing utility to eliminate any of your possible answers.
- A polar curve is given by the equation  $r = 5 - 4 \sin \theta$  for  $\theta \geq 0$ . What is the instantaneous rate of change of  $r$  with respect to  $\theta$  where  $\theta = \frac{\pi}{6}$ .
- Calculator active.** For a certain polar curve  $r = f(\theta)$ , it is known that  $\frac{dx}{d\theta} = \cos \theta - \theta \sin \theta$  and  $\frac{dy}{d\theta} = \sin \theta + \theta \cos \theta$ . What is the value of  $\frac{d^2y}{dx^2}$  at  $\theta = 5$ ?

1. -1	2. -20	3. $\frac{6}{\pi}, \frac{6}{11\pi}$ , eliminated $\frac{2}{\pi}$	4. $-2\sqrt{3}$	5. 0.206
